

## Math 1149

### Trigonometry

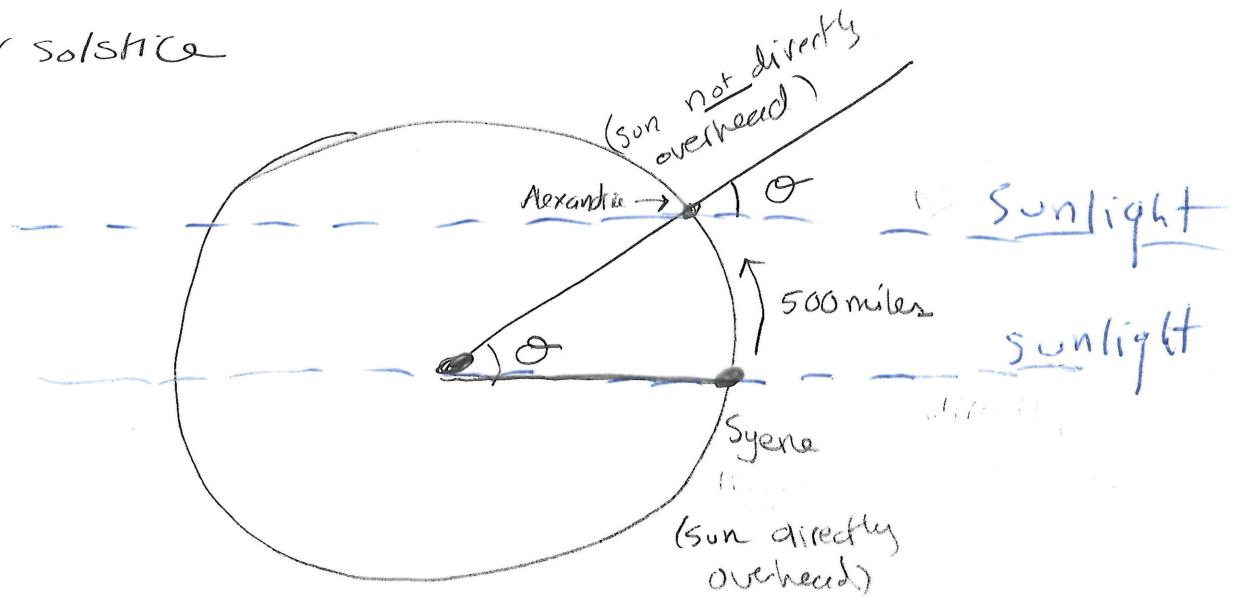

- Anyone know circumference of Earth? (25,000 miles)
- Guesses on when first calculated?
  - > Before or after 1957 - first satellite into orbit?
  - > Before or after Galileo (1500<sup>AD</sup>?)
  - > Before or after 1<sup>st</sup> crusade? (~1100 AD)
  - > Before or after Julius Caesar (~44 BC)

240 B.C. - Erathosthenes calculates circumference of Earth using trigonometry.

(1800 yrs before Galileo)

(2000 yrs before Library of Alexandria was burned down for the first time...)

On Summer solstice

$$\theta \approx 7.2^\circ \sim \frac{1}{50}^{\text{th}} \text{ of a circle.}$$

$$\text{So } 500 \text{ miles} = \frac{1}{50}^{\text{th}} \text{ of circumference}$$

$$\Rightarrow \text{circumference of Earth} \approx 25,000 \text{ miles.}$$

within 10% of current accepted value.

Within a week or two, you'll have knowledge to redo this calculation if you like

## Lecture

Today

- What is an angle?
- Degrees and radians
- Coterminal angles

### Angles

Intuitively, we know, e.g. what is  $90^\circ$  angle? 

More formally...

Def: A ray is "half of" a line, e.g.  or 

An angle is formed by rotating a ray.

almost always, our angles will be in standard position, i.e.

## Degrees and radians

These are ways to measure an angle

Degrees  
 $360^\circ = \{ \text{one full rotation} \}$

$\Rightarrow 1^\circ = \frac{1}{360}^{\text{th}}$  of a rotation

Radians We will use these!

One full rotation is  $\underbrace{2\pi \text{ radians}}_{360^\circ}$ .

$\Rightarrow$  half of a rotation is  $\underbrace{\pi \text{ radians}}_{180^\circ}$  etc.

How are they actually defined?

Imagine we have some angle

Draw a circle  
radius  $r$

Def The measure of  $\theta$  in radians is  $\theta = \frac{s}{r}$

Why is a full rotation  $2\pi$ ?

For a full rotation,  $s = \text{circum} = 2\pi r$ .

$$\Rightarrow \theta = \frac{s}{r} = \frac{2\pi r}{r} = 2\pi$$

Note (arc length)

Suppose we know  
How long is  $s$ ?

$$\theta = \frac{s}{r} \Rightarrow s = r\theta = 10 \cdot \frac{\pi}{4}$$

$$\approx 7.5$$

e.g. Find two angles: (one pos. one neg) coterminal to  $45^\circ$

or  
continue
